

(Knowledge for Development)

KIBABII UNIVERSITY

**UNIVERSITY EXAMINATIONS
2021/2022 ACADEMIC YEAR**

**END OF SEMESTER EXAMINATIONS
YEAR TWO SEMESTER TWO EXAMINATIONS**

**FOR THE DEGREE OF
BACHELOR OF COMPUTER SCIENCE**

**COURSE CODE : CSC 225
COURSE TITLE : DATA STRUCTURES**

DATE: 11/5/2022

TIME: 9.00 A.M – 11.00 A.M

INSTRUCTIONS TO CANDIDATES

ANSWER QUESTIONS ONE AND ANY OTHER TWO QUESTIONS.

QUESTION ONE (COMPULSORY) [30 MARKS]

- a) If you have to solve the searching problem for a list of n numbers, how can you take advantage of the fact that the list is known to be sorted? Give separate answers for
- lists represented as arrays. $(\text{low} + \text{high}) / 2$. [1 mark]
 - lists represented as linked lists. $n/2$ [1 mark]
- b) Show the stack after each operation of the following sequence that starts with the empty stack:

push(a), push(b), pop, push(c), push(d), pop c (top) [2 mark]
 a

- c) Show the queue after each operation of the following sequence that starts with the empty queue:

enqueue(a), enqueue(b), dequeue, enqueue(c), enqueue(d), dequeue
 c, d [2 mark]

- d) Why is sorting necessary? [1 marks]

- e) Consider the binary tree below:

sorting is necessary to improve search efficiency, organize data, enhance performance of algorithms and data structures, enable specific operations, and facilitate data analysis.

Write the order of the nodes visited in:

[6 marks]

- An in-order traversal,
 - A pre-order traversal,
 - A post-order traversal:
- f) In an array based implementation of the queue data structure, what strategy is used to avoid an array out of bounds error when the int variable, rear, storing the index of the next available array cell is incremented when its current value is $N-1$ where N is array size?

Modular Arithmetic

[2 marks]

- g) In recursive methods, we have the base case and the inductive/recursive case. What is the

- i) To insert a new item at the head of a linked list, follow these steps:
1. Create a new node with the data value of the new item.
 2. Set the next pointer of the new node to point to the current head of the linked list.
 3. Update the head pointer to point to the new node, making it the new head of the linked list.
 4. If the linked list was empty (head was initially pointing to NULL), set the new node as both the head and the tail of the linked list.
 5. The insertion process is now complete, and the new item has been successfully inserted at the head of the linked list.

importance of the base case?

[2 marks]

- h) Draw a complete binary tree with exactly six nodes. Put a different value in each node. Then draw an array with six components and show where each of the six node values would be placed in the array (using the usual array representation of a complete binary tree). [5 marks]
- i) What are the steps to inserting a new item at the head of a linked list? [3 marks]
- j) Outline any two applications of the stack data structure [4 marks]
- 1) Function call stack
 - 2) Undo functionality in text editor

QUESTION TWO [20 MARKS]

- a) What is the function of the reference *first/head* when used with a linked list? What is the data type of the *first* variable? [2 marks]
- b) Draw a diagram of a linked list that contains nodes with data items of type String that contains the name of a city and type double that contains a pollution index. Include an instance variable named *first* to indicate the beginning of the list. Insert the following nodes: Mombasa, 15.7, Nairobi, 23.2, Kitale, 7.2. [3 marks]
- c) Create a generic Node class to represent the linked list depicted in your diagrams above. [10 marks]
- d) Write a method called *displayList* that displays the data items in the Node class created in number (c) above. [5 marks]

QUESTION THREE [20 MARKS]

- a) State TWO different reasons to explain why the following binary tree is not a heap: [2 marks]

- b) Draw a new heap that is created by inserting 82 into the following heap: [2 marks]

$\begin{array}{cc} / \backslash & / \backslash \\ 68 & 1 \ 3 \ 11 \end{array}$

- c) What problem does binary search tree suffer from? **[2 marks]**
- d) Describe any two methods for storing binary trees in the computer. **[2 marks]**
- e) Suppose characters a, b, c, d, e, f have probabilities 0.07, 0.09, 0.12, 0.22, 0.23, 0.27, respectively.
 - i. Find an optimal Huffman code and draw the Huffman tree. **[8 marks]**
 - ii. What is the average code length? **[4 marks]**

QUESTION FOUR [20 MARKS]

- a) Describe why a very large hash table will likely increase the performance (i.e. faster additions and lookup) at the expense of wasting memory, and vice versa, why a small hash table will use less memory but result in a decrease in performance. **[4 marks]**
- b) Suppose that an open-address hash table has a capacity of 811 and it contains 81 elements. What is the table's load factor? **[2 marks]**
- c) Define the following as relates to hash tables:
 - i. Collision **[1mark]**
 - ii. Perfect hashing function **[1 mark]**
 - iii. Load factor **[2 marks]**
- d) Briefly describe one algorithm that is used for resolving collisions in a hash table. **[4 marks]**
- e) Draw a hash table with open addressing and a size of 11. Use the hash function " $k\%11$ ". Insert the keys: 5, 29, 20, 0, 27 and 18 into your table (in that order). **[6 marks]**

QUESTION FIVE [20 MARKS]

- a) Implement the following method. Do not use any local variables or loops. [7 Marks]

```
public static void pattern(int n)
```

```
// Precondition: n > 0;
```

```
// Postcondition: The output consists of lines of integers. The //first line is the number n.
The next line is the number 2n. The next //line is the number 4n, and so on until you
reach a number that is //larger than 4242. This list of numbers is then repeated backward
//until you get back to n.
```

```
/* Example output with n = 840:
```

```
840
1680
3360
6720
6720
3360
1680
840
```

```
*/
```

- b) Write a recursive method that has one parameter which is an int value called x. The method prints x asterisks, followed by x exclamation points. Do NOT use any loops. Do NOT use any variables other than x. [6 marks]
- c) Suppose that p, q, and r are all references to nodes in a linked list with 15 nodes. The variable p refers to the first node, q refers to the 8th node, and r refers to the last node. Write a few lines of code that will make a new copy of the list. Your code should set THREE new variables called x, y, and z so that: x refers to the first node of the copy, y refers to the 8th node of the copy, and z refers to the last node of the copy. [7marks]
